

Deployment Tutorial — Requirement 4

Add a Custom Domain to our Dog Slideshow Deployment

This tutorial guides you through connecting a GoDaddy domain to your deployed Dog Slideshow React App hosted on Azure Static Web Apps.

Step 1 — Add Custom Domain in Azure

1. Open your Azure Static Web App

- Go to: <https://portal.azure.com>
- Open your deployed **dog-slideshow** Static Web App.

2. Navigate to Custom Domains

Left Menu → **Custom Domains**
Click **Add**

3. Enter Your Domain Name

Example (replace with your actual domain):

`www.renuyama.com`

Azure will now generate a TXT verification record.

Step 2 — Add TXT Verification Record in GoDaddy

1. Log in to GoDaddy

Go to:
<https://godaddy.com> → Domain → DNS Management

2. Add the TXT Record

Type	Name	Value	TTL
TXT	@	(Azure verification code)	1 hour

Wait until Azure shows the status:

✓ Verified

This confirms domain ownership.

Step 3 — Add CNAME Record for “www”

Still in GoDaddy DNS, add:

Type	Name	Value
CNAME	www	zealous-stone-040b4e610.3.azurestaticapps.net

This ensures:

- `www.yourdomain.com` redirects correctly
- Your domain supports both root and www variants

Step 4 — SSL / HTTPS Certificate Setup

Azure will automatically create a **free SSL certificate**.

You do **not** need to upload anything.

Within a few minutes, the Custom Domains page should show:

✓ Domain Validated

✓ Certificate Issued

Your domain will now load securely:

<https://renuyama.com>

Final Expected Setup

Your environment now includes:

Requirement	Status
Dog Slideshow React App	✓ Working
Azure Static Web App	✓ Deployed
GitHub Actions	✓ CI/CD enabled
Custom Domain	✓ Connected
SSL Certificate	✓ Active
